

FacePulseRate: A Suite of Features to Facilitate the Use of iPhys Toolbox

FacePulseRate returns frame-by-frame blood volume pulse (BVP) and windows of pulse rate from a face present within a pre-recorded (not streaming) input video.

FacePulseRate is designed to return output from the four (as of November, 2019) blood volume pulse (BVP) algorithms provided by iPhys Toolbox (McDuff & Blackford, 2019). As in iPhys Toolbox, the pulse rate of an interval of time (termed a window here) is calculated from BVP by conducting a fast Fourier transform (FFT) to select the greatest peak.

Use Case

FacePulseRate has been designed for researchers interested in acquiring pulse rate from videos, which have the benefit of being recorded remotely and without contact, in contrast with traditional instruments. FacePulseRate is ready to use; that is, code does not need to be added or modified. In fact, all features of FacePulseRate are available from the relatively short Matlab scripts (i.e., .mlx files) included. Only introductory experience with programming languages is assumed.

Purpose

FacePulseRate adopts the approach of iPhys Toolbox, as well as other sources from the literature, by calculating pulse rate (1) from a relatively long duration and (2) as determined by the greatest peak in a periodogram. This contrasts to the calculation typically used for traditional measures, such as PPG or ECG, where a millisecond time scale may be used and local peak detection is used rather than a periodogram. Although it is possible to apply the calculations used for traditional measures on a video measure, it is unclear whether the noise often present in video data is conducive to that level of precision.

In the literature, the long duration typically used is the entire length of the video. For example, Poh, McDuff, and Picard (2011) recorded participants for 1 minute and then used the greatest peak from a periodogram to calculate pulse rate.

A limitation to taking pulse rate from the entire video is that this may not address research questions concerning changes in pulse rate across time. Addressing this limitation is the first purpose of FacePulseRate. To do so, FacePulseRate allows pulse rate to vary across time while still adhering to the use of a relatively long duration and the use of a periodogram. Specifically, FacePulseRate is implemented to take pulse rate separately from windows of time within the video. The default window duration is 1 minute, although an argument permits this to be changed to an arbitrary value (although constrained to be at least 2 seconds). The window duration can also be changed to be the length of video when a time-varying measure is not desired.

The second purpose is to provide features to make the collection of data from the videos convenient, accurate, diagnosable, and correctable. These features do not alter the pulse rate algorithms from iPhys Toolbox, but rather concentrate on obtaining data for input into the algorithms. Good data should facilitate

the accuracy of the pulse-rate algorithms. The features include ...

- Automatically positioning a face ROI for each frame using OpenCV (Viola-Jones) face detection and a novel skin-detection method.
- Providing a novel method of skin segmentation where thresholds are tailored from skin-color samples from the video.
- An argument that enables controlling for variation in luminance across frames (see Madan et al., 2018).
- Providing verification of ROI placement and skin-segmentation by providing an annotated output video. Arguments are available to make adjustments to ROI placement and skin-segmentation based upon inspection of the output video.

Input

Color Videos.

Supported file extensions include ...

- .mp4
- .avi

Other file extensions may be supported.

For additional discussion and recommendations, see
"Video_and_Recording_Environment_Recommendations.pdf".

This toolbox accepts pre-recorded video rather than video streams. The benefit of pre-recorded video is that some operations can be aware of the future (they can look ahead in the video), which improves the accuracy of ROI placement.

Output

The BVP and pulse rate results are provided, along with additional information, as output tables. Included among the additional information are the input video timestamps and means from the red, green, and blue color channels of an ROI from each frame; these two components of the data are the basis for the BVP. These tables are also written to CSV files. As previously mentioned, an output video is provided to facilitate corrections to ROI placement and skin segmentation. Code examples of corrections are provided in file `Examples_Correct_ROIs_and_Skin_Segmentation.mlx`.

In sum, ...

- Frame-by-frame BVP as Matlab table variable
- Frame-by-frame BVP as csv file
- Window-by-window pulse rate as Matlab table variable
- Window-by-window pulse rate as csv file

- Annotated output video

A Frame.

Frame	Timestamp_sec	BVP_Chrom	BVP_Green	PulseRate_Chrom	PulseRate_Green
1	.125	0	-.004	68	65
2	.167	-3.40E-06	.134	68	65
3	.208	-2.61E-06	.274	68	65

Frame-by-Frame Table. A few lines from the first window. Only a small selection of columns is shown. These columns show the output from the Chrom and Green algorithms.

Block	Window	Chrom	Green	ICA	POS
1	1	68	65	68	69
1	2	70	70	71	72

Window-by-Window Table. Pulse rate from the 2 windows used. Pulse rate is from the Chrom, Green, ICA, and POS algorithms. Segmenting data by block is optional.

Interface

- Matlab (see software requirements below)

System Requirements

- 64-bit Windows

Currently, 64-bit macOS has not been implemented or tested.

Software Requirements

- Matlab. FacePulseRate has been tested on Matlab versions 2020a and 2020b. Matlab can often be acquired without cost through a university affiliation.

The following Matlab toolboxes are also required. Note that these toolboxes require corresponding licenses from Matlab. However, these can often be acquired without cost through a university affiliation. These are the toolbox names as of Matlab release 2020b; toolboxes are occasionally renamed.

- Statistics and Machine Learning Toolbox
- Computer Vision System Toolbox
- Image Processing Toolbox
- Signal Processing Toolbox
- DSP System Toolbox
- Optimization Toolbox

Instructions

Most of the features of FacePulseRate occur automatically, so few lines of code need to be used to return results under default options. For example, once the required toolboxes have been installed and FacePulseRate Toolbox is placed on Matlab's path, entering the following line in Matlab is all that is needed to return results:

```
FacePulseRate(<\...\MyInputVideo.mp4>);
```

Study Preparation

Experience has indicated at least two steps of preparation should be undertaken before data collection:

1. Optimize the video recording environment. See [Video_and_Recording_Environment_Recommendations.pdf](#).
2. Conduct pretests. See [Pretesting.pdf](#).

Setup

1. Install Matlab on a Windows 64-bit computer. Matlab version 2020a or later is recommended. Matlab is

often provided at no cost through a university affiliation.

2. Install the following Matlab toolboxes. As of Matlab version 2020b, Matlab toolboxes can be installed in the Matlab environment through Apps > Install App. The following toolboxes are often provided at no cost when using an academic license.

- Statistics and Machine Learning Toolbox
- Computer Vision System Toolbox
- Image Processing Toolbox
- Signal Processing Toolbox
- DSP System Toolbox
- Optimization Toolbox

3. Obtain the files for FacePulseRate. As of October 2020, the files can be found on Github.com under iphys-toolbox. Specifically, FacePulseRate Toolbox is a fork of iphys-toolbox.

General Use

See code examples for general use in "Examples_General_Instructions.mlx".

Note: .mlx files can only be displayed in the Matlab Environment.

Corrections to ROI Placement or Skin Segmentation

See code examples for correcting ROI Placement or Skin Segmentation in "Examples_Correct_ROIs_and_Skin_Segmentation.mlx".

Note: .mlx files can only be displayed in the Matlab Environment.

Implementation

FacePulseRate consists of about 10,000 lines of Matlab code and includes compiled-C code for performance benefits. Compiled code is also used from the FFmpeg (r) project for efficiency. However, no code needs to be modified and no files need to be compiled to use FacePulseRate.
